

ASSOCIATION INTERNATIONALE POUR UNE MÉDECINE SCIENTIFIQUE INDÉPENDANTE ET BIENVEILLANTE

Vaccin hépatite B et SEP / démyélinisations centrales

Introduction

Il existe en France une défiance inquiétante à l'égard de la vaccination, qui se traduit par une couverture insuffisante pour certains vaccins, susceptible de conséquences infectieuses graves.

[...]

La vaccination est, à côté de l'hygiène publique, un pilier historique de l'action de santé publique contre les maladies infectieuses.

[...]

[c'est] « une avancée majeure en matière de santé, un droit à la prévention individuelle, mais aussi un devoir de prévention collective.»

La dernière méta-analyse

Principe d'une « méta-analyse »

- → Revue de la littérature
- → Analyse statistique et pooling
- → Conclusion ?

Problématiques :

- Qualité des études intégrées
- → Hétérogénéité des données
- → Biais de publication

Stratégie des industriels : inonder les revues de publications très rassurantes pour fabriquer le consensus (efficacité / tolérance)

Exemple : seeding trials → essais à seul objectif marketing mais non présentés comme tels (estimation : 20 % / 1 essai sur 5 *)

- ► Quand les résultats sont mauvais on ne publie pas
- ➤ Au pire on falsifie les données (Thompson → ROR / autisme; Merck → M-M-R-II / valence oreillons; efficacité Cervarix 3 cancers vaccinées vs. 1 contrôles; reporting AEs essais anti HPV...)

Association of infectious mononucleosis with multiple sclerosis. A population-based study.; Neuroepidemiology. 2009;32(4):257-62. doi: 10.1159/000201564. Epub 2009 Feb 11.

→ Étude canadienne sur la SEP: 14,362 cas et 7,671 témoins

Specific to this study, all MS index cases were asked whether or not they had suffered from selected viral diseases as a child and whether they had received certain vaccines during early life.

Étude faite sur questionnaire sans même demander l'antécédence de la maladie infectieuse ou du vaccin par rapport à la survenue de la SEP

Interviewees were asked to respond to questions regarding clinical infection or vaccination history with a choice of three responses: 'yes', 'no' or 'unknown'.

Étude de qualité douteuse

Our study does have limitations. As infectious mononucleosis was not asked about specifically, and the fact that MS index cases and spousal controls are being asked about infectious diseases/vaccinations that occurred decades previously means that information collected is liable to reporting and recall bias. Nevertheless, the data obtained in this study shows striking similarity to previous observations.

- → Biais de mémorisation (« decades » ?!?!)
- * Antécédence de la cause présumée non contrôlée
- → Contrôle administratif de l'exposition ? non
- → Vacciné avec quel produit ? on ne sait pas
- → Durée de survenue des symptômes post vaccin ? on ne sait pas non plus

Étude de qualité douteuse

Résultats

	p value	Odds ratio	95% CI
Mumps	0.62	0.98	0.92-1.05
Mumps vaccine	0.02^{a}	1.09	1.01-1.17
Measles	0.47	0.97	0.91 - 1.05
Measles vaccine	0.04^{a}	1.08	1.00-1.16
Rubella	0.06	0.93	0.87 - 1.00
Rubella vaccine	0.03^{a}	1.09	1.00-1.17
Influenza vaccine	0.52	1.02	0.96 - 1.09
Hepatitis B vaccine	0.07	0.92	0.84 - 1.01
Varicella	0.06	1.07	1.00-1.14
Infectious mononucleosis	< 0.001	2.06	1.71-2.48

CI = Confidence interval.

^a Not significant after correction for multiple testing.

MULTIPLE SCLEROSIS ONSET IN ADULTS

Two controlled studies (Ramagopalan et al., 2009; Touze et al., 2002) had very serious methodological limitations that precluded their inclusion in this assessment. Ramagopalan et al. (2009) did not attempt to validate self-reported vaccination data or confirm the timing of vaccination, and the choice of spousal controls could have introduced selection bias.
